

Iboga Medicine

Iboga is an ancient plant medicine that the Bwiti Tribes of West Africa have been using for thousands of years for physical, mental, and spiritual healing. Despite the Bwiti's long and successful history with this plant medicine, the western medical society has gravely overlooked Iboga's powerful healing properties. Iboga has the known ability to heal the body, mind, and soul, yet it remains largely unexplored by modern medicine. While some progress has been made in studying Iboga, there is still much to uncover about Iboga's undeniable potential to facilitate holistic healing. Iboga's profound effects on spiritual consciousness and physical & mental well-being make it a promising candidate for further research and integration into mainstream healing practices.

Moughenda

10th Generation Missoko Bwiti Shaman

Sarah

Sarah is a traditionally trained Missoko Bwiti Iboga provider who trained under 10th Generation High Shaman Moughenda Mikala in Gabon, Africa. While in Gabon, Sarah completed both provider training & drug & alcohol detox training and received the blessing from Moughenda to bring Iboga medicine & the Bwiti Tradition to the west to help reach people in need of healing.

Iboga for Pain

The neural systems associated with chronic pain oftentimes remain a mystery in our current medical world, and existing treatments are typically found to be ineffective. Iboga is shown to have many beneficial effects on the body's neurological systems. Not only does it support the function, survival, and growth of both existing & new brain cells, it also stimulates the formation of new connections made between neurons. Iboga has a profound effect on several neurotrophic factors and neurotransmitters in the brain such as BDNF, GDNF, NGF, dopamine, & serotonin. All of which have been shown to play an important role in pain modulation. Given Iboga's ability to show positive effects on a dysfunctional neural system, it is a compelling therapeutic treatment for neuropathic pain. Most people report instant pain relief after participating in a single Iboga retreat.

The following is a testimonial from an Iboga Revive client who suffered a crippling spinal injury when she was just 14 years old.

"I have had chronic pain every day of my 60 years.... The healing came with the first ceremony and 3 months later I am still pain-free."

-Judy-

Is Iboga Safe?

When practiced correctly, Iboga is absolutely safe. However, it is not for everyone. Before participating in an Iboga retreat, all clients must go through rigorous medical screening to ensure there are no contraindications to Iboga medicine. Every client must provide a recent EKG and full blood panel showing results within safe range before taking Iboga medicine. In rare documented cases where medical intervention was needed, findings show that traditional protocols were not followed and clients were not properly screened. This is why it's imperative you choose a provider who is traditionally trained & works within the integrity of Iboga medicine & the Bwiti Tradition.

Iboga Revive Healing Retreats

All of our retreats are designed to focus on physical healing first and then move on to any deeper psychological & spiritual healing that is needed.

Psycho-Spiritual Retreats

For those seeking relief from physical, psychological, and/or spiritual pain.

Non-Active Detox Retreats

For those who have recently struggled with dependency to pharmaceuticals or other substances but have since stopped and are no longer physically dependent.

Active Detox Retreats

For those who are seeking to break free from their current dependency to pharmaceuticals or other substances.

Touch Up Ceremony Retreat

For those who have already experienced a traditional Iboga retreat consisting of at least two ceremonies and would like to return for an additional ceremony. This may be necessary for clients who have a lot of physical healing to address because physical healing can take some time to fully repair.

Get a Deeper Understanding

NGF

Nerve Growth Factors are shown to protect the brain & accelerate neurological recovery. Iboga boosts the production of NGF in the brain aiding in its repair.

BDNF

Brain-derived Neurotrophic Factors have many beneficial roles but specifically influence pain perception and sensitization. Iboga has been shown to stimulate the production of BDNF which can help eliminate pain.

GDNF

Glial Cell Derived Neurotrophic Factors play an important role in preventing & reversing neuropathic pain. Iboga has the ability to increase GDNF & has a restorative effects on the brain's ability to relieve symptoms of pain.

Dopamine

Chronic pain can have a negative effect on dopamine levels in the brain. Iboga has shown to upregulate & correct dopamine deficiencies.

Serotonin

Low serotonin levels can contribute to chronic neuropathic pain. Iboga resets & stabilizes serotonin levels in the brain which can lead to patients experiencing less pain.

Not only can Iboga help relieve physical pain, it can help sever your attachment to pain by bringing the Truth to the false beliefs that surround it.
